PROFESSIONAL SUMMARY

Systems and infrastructure professional moving into information security, backed by hands-on applied-security engineering (authentication, encryption, webhook integrity, zero-trust access control) and day-to-day management of endpoints, identities, and export-controlled data in a regulated aerospace environment. Self-directed offensive- and defensive-security practitioner (Hack The Box; self-hosted SSO-gated homelab). Well suited to a global security role and ready to take formal ownership of incident response, identity, and access governance.

TECHNICAL SKILLS

Security & Identity: Active Directory (provisioning, account disablement, credential resets) · Authentik SSO / forward-auth · OAuth 2.0 · HMAC-SHA256 signature verification · AES-256-GCM encryption · secrets management · Nmap · ClamAV · Hack The Box · Splunk (academic)

Endpoint & Infrastructure: IBM BigFix · Jamf MDM · Proxmox · Cloudflare Tunnel (zero-exposure access) · Docker · Linux · Windows · macOS · GCP · AWS

Automation & Development: Python · Bash · TypeScript / Next.js · Git · REST APIs · webhook integrations · OCR pipelines

Governance & Compliance (exposure): Export-controlled (ITAR / EAR) document handling · PCI-DSS-aware payment design

PROFESSIONAL EXPERIENCE

Engineering Systems Analyst — Chromalloy

Nov 2025 – Present

Bangkok, Thailand · Aerospace / gas-turbine components

- Manage endpoint software deployment and patching across the device fleet with IBM BigFix and provide remote support via Windows RDP; resolved ~200 support tickets since joining.
- Administer identity and access through Active Directory — account provisioning, disablement, and credential resets — the same containment actions used in incident response.
- Support access to export-controlled (ITAR / EAR) engineering documentation through the internal DocManager system, enforcing U.S. person access restrictions on sensitive data.
- Built an automated OCR pipeline for inbound paper purchase orders: folder-watched ingestion → OCR extraction → auto-translation of key fields for Thai-speaking staff, cutting manual data entry and turnaround.

Systems Administrator — KIS International School

Apr 2025 – Nov 2025

Bangkok, Thailand

- Administered Active Directory for 1,000+ users and managed the Apple device fleet with Jamf MDM.
- Migrated on-premise servers to Google Cloud Platform for backup and virtual-machine management.
- Automated project workflows to reduce manual error, contributing to a 20% reduction in project costs and ~25% efficiency gain.

IT Support Analyst — Monash University

Feb 2024 – Feb 2025

Melbourne, Australia

- Diagnosed and resolved hardware and software issues across BYOD devices, minimizing downtime for students and staff.
- Monitored and remediated issues through Slack-integrated automations and applied IT best practices to improve productivity.

SECURITY & TECHNICAL PROJECTS

Lekha — LINE-based AI Assistant (TypeScript, Next.js, Vercel)

lekha-iota.vercel.app

- Engineered application-layer security for a public multi-user platform: HMAC-SHA256 verification of inbound webhooks (timing-safe, validated before any processing) to reject spoofed requests.

- Encrypted OAuth refresh tokens at rest with AES-256-GCM and hardened the OAuth flow against CSRF/replay using signed single-use tokens and TTL-bound server-side nonces.
- Bound user identity to the verified webhook (never to model-supplied input) to prevent impersonation; added per-user rate limiting, event de-duplication, and a confirmation gate before any outbound action.

Self-Hosted Security Homelab *Proxmox · Authentik · Cloudflare · ClamAV*

- Designed a zero-trust access model with Authentik forward-auth in front of every service, centralizing SSO and per-user allow/deny control.
- Published services securely via Cloudflare Tunnel with no open inbound ports, gated by out-of-band access approval through a messaging-app workflow.
- Operate virtualization and self-hosted services (Proxmox, Docker, Nextcloud, Immich, Grafana) on efficient low-power hardware.
- Implemented a DMZ style Antivirus using ClamAV for file hosting services.

GingerBros — Secure E-commerce Payments *Stripe · Webhooks*

- Designed checkout to keep cardholder data entirely out of PCI scope by delegating to Stripe's hosted, PCI-DSS-compliant Checkout.
- Verified Stripe webhook signatures to guarantee payment-event integrity and block forged confirmations, with secure API-secret management.

Additional Projects

- **PassClass — Lecture Summarizer** (Python, AWS Bedrock): coursework-to-summary and flashcard system; awarded Most Innovative Project.
- **AMBER Energy Hackathon**: Python ML solution optimizing electricity trading via demand and price prediction.
- **VR Helicopter Simulator** (Unity): six-person Scrum team; presented to Boeing and aerospace industry leaders.

EDUCATION

Bachelor of Information Technology — RMIT University *2023 – 2025*

Specialization in Computer Networking

Associate Degree in Information Technology — RMIT University *2022 – 2023*

CERTIFICATIONS & CONTINUOUS LEARNING

- CompTIA Network+
- SFPC — Scrum Foundation Professional Certificate
- Hack The Box (@jamesPerenchio) — ongoing offensive & defensive security practice

LANGUAGES

English (Fluent) · Thai (Conversational)
